

## Key comparison CCAUV.A-K1

**MEASURAND :** Pressure sensitivity level of laboratory standard microphone type LS1P  
**NOMINAL VALUE :** 0 dB

$x_i$ : result of measurements carried out by laboratory  $i$  (designated as  $M_i$  in the CCAUV.A-K1 Final Report)  
The quoted pressure sensitivity levels are the mean of measurements on two microphones, relative to the arithmetic mean value of all such measurement made in this key comparison.  
The nominal value is therefore 0 dB, the key comparison reference value.

$u_i$ : combined standard uncertainty of  $x_i$ ,  
The uncertainty quoted in the table is  $2u_i$ , so that it can be given at a resolution consistent with the measured data.

## Key comparison CCAUV.A-K1

**MEASURAND :** Pressure sensitivity level of laboratory standard microphone type LS1P  
**NOMINAL VALUE :** 0 dB

The key comparison values,  $x_R$  (designated as  $M_{ref}$  in the CCAUV.A-K1 Final Report), are obtained as the arithmetic means of all measurements, normalized to zero decibels, at each frequency.

At a given frequency, the combined standard uncertainty,  $u_R$ , of the key comparison reference value is determined by propagating the individual measurement uncertainties.

Frequency	$x_R$	$u_R$
/ Hz	/ dB	/ dB
63	0.00	0.006
125	0.00	0.006
250	0.00	0.005
500	0.00	0.005
1000	0.00	0.005
1250	0.00	0.006
1600	0.00	0.006
2000	0.00	0.006
2500	0.00	0.006
3150	0.00	0.006
4000	0.00	0.006
5000	0.00	0.007
6300	0.00	0.008
8000	0.00	0.011

At a given frequency, the degree of equivalence of each laboratory with respect to the key comparison reference value is given by a pair of terms:  $D_i = (x_i - x_R)$ , and its expanded uncertainty ( $k = 2$ ),  $U_i = 2[(1 - 2/n)u_i^2 + u_R^2]^{1/2}$ , where  $n$  is the number of participants, both expressed in dB.

At a given frequency, the degree of equivalence between two laboratories  $i$  and  $j$  is given by a pair of terms:  $D_{ij} = (x_i - x_j)$ , and its expanded uncertainty ( $k = 2$ ),  $U_{ij} = 2(u_i^2 + u_j^2)^{1/2}$ , both expressed in dB.

The full matrix of equivalence is computed for the frequency 250 Hz.  
Data for mutual equivalence at other frequencies can be derived from the table of individual measurements.  
However, the data at 250 Hz is characteristic of frequencies up to 2 kHz.

## Linking key comparison EUROMET.AUV.A-K1 to key comparison CCAUV.A-K1

NPL, DPLA and PTB provide the link between key comparisons CCAUV.A-K1 and EUROMET.AUV.A-K1.

The process involves calculating the average result of the linking participants at each frequency, in each comparison. The difference between the average result relative to the CCAUV.A-K1 key comparison reference value and relative to the EUROMET.AUV.A-K1 internal reference provides a linking factor  $d$ , which is used to convert the results relative to the EUROMET internal reference, so they become relative to the CCAUV.A-K1 key comparison reference value.

Frequency / Hz	Average value of results from NPL/DPLA/PTB in EUROMET.AUV.A-K1 / dB	Average value of results from NPL/DPLA/PTB in CCAUV.A-K1 / dB	$d$ / dB
63	-0.013	0.008	0.021
125	0.001	0.005	0.004
250	0.005	0.004	-0.001
500	0.005	0.003	-0.001
1000	0.002	0.009	0.007
1250	-0.001	0.012	0.014
1600	0.003	0.013	0.009
2000	0.004	0.011	0.007
2500	-0.002	0.013	0.015
3150	0.010	0.012	0.002
4000	0.014	0.014	-0.001
5000	0.021	0.016	-0.005
6300	0.034	0.019	-0.015
8000	0.031	0.010	-0.021
10000	0.004	-0.006	-0.010

At a given frequency, the degree of equivalence of one laboratory participant in EUROMET.AUV.A-K1 with respect to the key comparison reference value is given by a pair of terms:  $D_i = (x_{i-EUR} + d)$ , and its expanded uncertainty ( $k = 2$ ),  $U_i = 2(u_{i-EUR}^2 + u_R^2)^{1/2}$ , both expressed in dB.

Full graphs of equivalence are given for frequencies 250 Hz and 1000 Hz.

At a given frequency, the degree of equivalence between two laboratories  $i$  and  $j$  is given by a pair of terms:  $D_{ij} = (x_i - x_j)$ , and its expanded uncertainty ( $k = 2$ ),  $U_{ij} = 2(u_i^2 + u_j^2)^{1/2}$ , both expressed in dB.

The index  $i$  (or  $j$ ) should be taken as  $i$ -EUR (or  $j$ -EUR) when the corresponding laboratory has participated in EUROMET.AUV.A-K1 only.

The matrix of equivalence computed at frequency 250 Hz from results obtained in CCAUV.A-K1 is extended with pair-wise degrees of equivalence between participants having participated in EUROMET.AUV.A-K1 only.

The pair-wise degrees of equivalence between one laboratory participant in CCAUV.A-K1 and one laboratory participant in EUROMET.AUV.A-K1 only may be computed using the equations given above.

Other numbers are available from Annex A of the EUROMET.AUV.A-K1 Final Report.

## Linking key comparison APMP.AUV.A-K1 to key comparison CCAUV.A-K1

NMIJ and KRISS provide the link between key comparisons CCAUV.A-K1 and APMP.AUV.A-K1. NMIA also took part in both key comparisons, but was not included as a linking laboratory because it used different equipments.

The process involves calculating the average result of the linking participants at each frequency, in each comparison. The difference between the average result relative to the CCAUV.A-K1 key comparison reference value and relative to the APMP.AUV.A-K1 internal reference provides a linking factor  $d$ , which is used to convert the results relative to the APMP internal reference, so they become relative to the CCAUV.A-K1 key comparison reference value.

Frequency	Average value of results from NMIJ/KRISS in APMP.AUV.A-K1	Average value of results from NMIJ/KRISS in CCAUV.A-K1	$d$
/ Hz	/ dB	/ dB	/ dB
63	0.004	0.003	-0.002
125	0.000	0.000	0.000
250	-0.001	-0.006	-0.005
500	0.000	-0.003	-0.002
1000	-0.002	-0.003	-0.002
1250	-0.003	-0.003	0.000
1600	-0.005	-0.004	0.001
2000	-0.005	-0.003	0.002
2500	-0.010	-0.006	0.004
3150	-0.014	-0.007	0.006
4000	-0.016	-0.010	0.007
5000	-0.020	-0.012	0.008
6300	-0.027	-0.026	0.001
8000	-0.017	-0.015	0.001

At a given frequency, the degree of equivalence of one laboratory participant in APMP.AUV.A-K1 with respect to the key comparison reference value is given by a pair of terms:  $D_i = (x_{i-APMP} + d)$ , and its expanded uncertainty ( $k = 2$ ),  $U_i \sim 2(u_{i-APMP}^2 + u_R^2)^{1/2}$ , both expressed in dB.

The exact formula used to compute  $U_i$  is given in equation 12 on page 22 of the APMP.AUV.A-K1 Final Report.

Full graphs of equivalence are given for frequencies 250 Hz and 1000 Hz.

At a given frequency, the degree of equivalence between two laboratories  $i$  and  $j$  is given by a pair of terms:  $D_{ij} = (x_i - x_j)$ , and its expanded uncertainty ( $k = 2$ ),  $U_{ij} = 2(u_i^2 + u_j^2)^{1/2}$ , both expressed in dB.

The index  $i$  and  $j$  should be taken as  $i$ -APMP and  $j$ -APMP when both laboratories have participated in APMP.AUV.A-K1 only.

The formula to be used to compute  $U_{ij}$  for a pair composed of one participant in CCAUV.A-K1 and one participant in APMP.AUV.A-K1 is given in equation 18 on page 22 of the APMP.AUV.A-K1 Final Report.

The matrix of equivalence computed at frequency 250 Hz from results obtained in CCAUV.A-K1 and EUROMET.AUV.A-K1 is extended with pair-wise degrees of equivalence between laboratories having participated in APMP.AUV.A-K1 only.

## Linking key comparison SIM.AUV.A-K1 to key comparison CCAUV.A-K1

NRC, NIST and CENAM provide the link between key comparisons CCAUV.A-K1 and SIM.AUV.A-K1, which is computed using a generalized linear least-squares method, as explained in Annex B on page 19 of the SIM.AUV.A-K1 Final Report.

At a given frequency, the degree of equivalence of one laboratory participant in SIM.AUV.A-K1 only, with respect to the CCAUV.A-K1 key comparison reference value, is given by a pair of terms:  $D_i$ , and its expanded uncertainty ( $k = 2$ ),  $U_i$ , both expressed in dB. These are computed as explained in Annex B of the SIM.AUV.A-K1 Final Report.

Full graphs of equivalence are given for frequencies 250 Hz and 1000 Hz.

At a given frequency, the degree of equivalence between two laboratories  $i$  and  $j$  is given by a pair of terms:  $D_{ij}$ , and its expanded uncertainty ( $k = 2$ ),  $U_{ij}$ , both expressed in dB. These are computed as explained in Annex B of the SIM.AUV.A-K1 Final Report.

The matrix of equivalence computed at frequency 250 Hz from results obtained in CCAUV.A-K1, EUROMET.AUV.A-K1, and APMP.AUV.A-K1 is extended with pair-wise degrees of equivalence between laboratories having participated in SIM.AUV.A-K1 only.

## Linking key comparison APMP.AUV.A-K1.1 to key comparison CCAUV.A-K1

KRISS provides the link between key comparisons CCAUV.A-K1 and APMP.AUV.A-K1.1. The linking process is explained in section 8 of the APMP.AUV.A-K1.1 Final Report.

At a given frequency, the degree of equivalence of KIM-LIPI participant in APMP.AUV.A-K1.1 only, with respect to the CCAUV.A-K1 key comparison reference value, is given by a pair of terms:  $D_i$ , and its expanded uncertainty ( $k = 2$ ),  $U_i$ , both expressed in dB. These are computed as explained in section 8 of the APMP.AUV.A-K1.1 Final Report.

Full graphs of equivalence are given for frequencies 250 Hz and 1000 Hz.

No pair-wise degrees of equivalence are computed between KIM-LIPI and participants in CCAUV.A-K1 and other linked key comparisons.

## Linking key comparison COOMET.AUV.A-K1 to key comparison CCAUV.A-K1

GUM, PTB and VNIIIFTRI provide the link between key comparisons CCAUV.A-K1 and COOMET.AUV.A-K1. The linking process is explained in section 6 of the COOMET.AUV.A-K1 Final Report.

At a given frequency, the degree of equivalence of one laboratory  $i$  participant in COOMET.AUV.A-K1 only, with respect to the CCAUV.A-K1 key comparison reference value, is given by a pair of terms:  $D_i$  and its expanded uncertainty ( $k = 2$ ),  $U_i$ , both expressed in dB. These are computed as explained in section 6 of the COOMET.AUV.A-K1 Final Report.

Full graphs of equivalence are given for frequencies 250 Hz and 1000 Hz.

At a given frequency, the degree of equivalence between two laboratories  $i$  and  $j$  is given by a pair of terms:  $D_{ij}$ , and its expanded uncertainty ( $k = 2$ ),  $U_{ij}$ , both expressed in dB. These are computed as explained in section 6 of the COOMET.AUV.A-K1 Final Report.

The matrix of equivalence computed at frequency 250 Hz from results obtained in CCAUV.A-K1, EUROMET.AUV.A-K1, APMP.AUV.A-K1, SIM.AUV.A-K1 and APMP.AUV.A-K1.1 is extended with pair-wise degrees of equivalence between laboratories having participated in COOMET.AUV.A-K1 only.

## Linking key comparison CCOMET.AUV.A-K1.1 to key comparison CCAUV.A-K1

PTB provides the link between key comparisons CCAUV.A-K1 and COOMET.AUV.A-K1.1. The linking process is explained in section 6 of the COOMET.AUV.A-K1.1 Final Report.

At a given frequency, the degree of equivalence of DNDI participant in COOMET.AUV.A-K1.1 only, with respect to the CCAUV.A-K1 key comparison reference value, is given by a pair of terms:  $D_i$  and its expanded uncertainty ( $k = 2$ ),  $U_i$ , both expressed in dB. These are computed as explained in section 6 of the COOMET.AUV.A-K1.1 Final Report.

Full graphs of equivalence are given for frequencies 250 Hz and 1000 Hz.

No pair-wise degrees of equivalence involving DNDI are given here.

Key comparisons CCAUV.A-K1, EUROMET.AUV.A-K1, APMP.AUV.A-K1, SIM.AUV.A-K1, APMP.AUV.A-K1.1, COOMET.AUV.A-K1, and COOMET.AUV.A-K1.

Degrees of equivalence relative to the key comparison reference values

Note: Many of the values for  $U_i$  appear to be the same as the corresponding value for  $2u_i$  in the tables of individual measurements. This is due to the variation in uncertainty  $u_i$  being small between participants, the relatively low value of  $u_R$  compared to  $u_i$ , and the rounding of the data to two decimal places that has been adopted in the tables. If the data were expressed with greater precision it would be apparent that they have different numerical values.
